

The AppSense Management Center provides a system that enables centralized management and deployment of AppSense software to computers on corporate networks. This includes mechanisms for centralized alert and event monitoring, policy configuration and reporting.

The Management Center is comprised of a Management Server, SQL Server, Management Console and the Client Communications Agent (CCA). It is fully integrated with the individual components of the AppSense Management Suite to provide a comprehensive User Environment Management solution, capable of delivering consistent, contextual, secure and responsive user environments.

Benefits

- Proactive, real-time management of user environments minimizes the need for IT attention and therefore cost.
- Utilizing proven Microsoft Web Services and with tight Microsoft Active Directory integration, authentication and secure communications are standard between all managed devices and the Management Center.
- Centralized auditing and reporting of all user generated events provides instant visibility into pending issues.
- Single management solution across multiple application delivery mechanisms reduces management overhead.
- Take advantage of AppSense technology on the latest 32-bit and 64-bit platforms.

Key Features

Active Directory authentication

Tight integration with Microsoft Active Directory allows authentication of all managed devices before communications are established.

Automatic client registration

New Directory Groups allow membership rules to be configured in advance, so new clients registering with the Management Server are automatically placed in the correct Deployment group.

Client Communications Agent (CCA)

The CCA can be deployed out from a centralized location and resides on each managed device, handling all communications, package installations and audit data collection / transfer.

Highly scalable

Built using proven Microsoft Web Services, the Management Center offers high scalability for large organizations.

Reporting system

A rich, interactive set of reports for auditing user environment usage. Based on audit data stored in the centralized Management Center, these reports display a complete audit history across the entire enterprise. Flexible options for grouping and filtering allows you to create and export customized reports showing relative information to suit your business needs.

Rich Management Console

A flexible .NET management console offers a comprehensive, yet simple administrative experience.

Roles based access

User can be granted read-only or full access to the various views within the Management Console. Access is automatically prohibited for any user not authorized to view deployment, auditing or configuration data.

Secure web-based communications

Built on WinHTTP, BITS and IIS 6 technologies, all data transfers and communications can be managed across HTTPS or HTTP protocols.

Watchdog agent

The Watchdog agent resides on each managed device. Should any of the AppSense agents stop unexpectedly or become unstable, the Watchdog will audit the detected error, and make corrective actions to restart the agent.

X64 Support

Provides support for installation of the Management Server and AppSense Client Computing Agent on 32-bit or 64-bit platforms.
